

ServiTech, Inc. Employee Manager

Dan Morgan
Software Designer

Project Overview

Project Description :

The Employee Manager is web app to manage a custom database of active (current) and inactive (former) employees.

The database is used to feed the employee pick lists in other services, like the Asset Manager, and to serve as the backend database for the company directory

Purpose:

When management proposed the idea and need for an asset manager, I knew we need a way to manage and populate the pick list of employees, both current and former, in the assignment and check-in of assets.

Additionally, ServiTech had not had an internal company directory with profile photos for several years and I knew this project would go far into accomplishing that need as well.

Role & Responsibilities:

Software Designer for ServiTech, Inc.

- Mapped the event triggers
- Wire framed the low fidelity mockups in Adobe XD
- Designed the high fidelity prototypes in HTML/CSS using Bootstrap framework and some custom CSS classes
- Defined the database schema
- Populated the database with employee information

Constraints:

Project duration: April–November 2023

Cross-platform web app required to take into account devices from mobile phone, tablet, laptop, and desktop computers.

Light weight enough to run on rural internet and cell phone service.

Users and Challenges

Primary Users :

- Division leaders
- Executive management team
- HR staff

Goals:

- Consistent interface and intuitive user experience
- RTU: Ready to use system with all current employees pre-loaded
- Serve as the backend for Asset Manager pick lists and Company Directory
- Cross-platform, mobile-first web app light weight enough to run on rural internet connections and cell service

Challenges:

- By designing and building this service in parallel with the Asset Manager, many of the same issues were also solved.
- The biggest future challenge will be keeping the database up-to-date as new employees are hired and others leave the company.

Process and Approach

I mocked up rough layouts in Adobe XD to get a feel for how a $\frac{1}{3}$ – $\frac{2}{3}$ split of the viewport would look on laptops, desktops, tablets, while considering where the breakpoints would best be for a portrait oriented mobile phone device.

Early on I settled on a scrolling left pane with a list of the the devices in small cards with the details of each managed device in the larger right pane.

Left one-third of viewport that scrolls

Right two-thirds of viewport that can scroll as needed

Process and Approach

The mobile phone view opens with a scrolling list of the devices in individual cards.

The detail view slides over when a card is selected.

For this project I provided working HTML and CSS files primarily using the Bootstrap framework and some custom CSS styling.

Scrolling list of devices
on cards

Detail of a single device that
scrolls vertically.

Results and Outcomes

The time elapsed between the ideation and final shipped web app was shorter than Asset Manager as we needed this database running to feed the pick lists in Asset Manager.

Once the schema was defined and the app was launched, I had the development team upload my pre-formatted text data to the schema. Then I added the photos by hand using the interface.

Before November the Employee Manager was up and running to feed the Asset Manager pick lists and Company Directory.
